

Executive Data Dictionary — Shopify Sales Analytics (Power BI)

A reference set of DAX queries written for the "Senior Executive Lens": totals, trends, concentration risk, and channel ROI — each answerable in under 5 numbers, no row-level detail required. Run these directly in Power BI Desktop's **DAX query view** against the semantic model.

1. Executive Summary (one-glance snapshot)

```
dax

EVALUATE
ROW(
    "Total Revenue", [Total_Revenue],
    "Total Orders", [Total_Orders],
    "Avg Order Value", [Average_Order_Value],
    "Refund Rate", [Refund_Rate],
    "Total Customers", [Total_Customers],
    "New Customers", [New_Customers],
    "Organic Sales", [Organic_Sales],
    "Ad Sales", [Ad_Sales]
)
```

Result: \$89,858.68 revenue · 420 orders · \$213.95 AOV · 6.9% refund rate · 157 customers · 10 new customers · Organic \$45,274.52 vs Ad \$44,584.16

2. Top 10 Customers by Revenue (LTV / customer concentration)

```
dax

EVALUATE
TOPN(
    10,
    SUMMARIZECOLUMNS(
        Customers[customer_name],
        Customers[city],
        "Revenue", [Total_Revenue],
        "Orders", [Total_Orders]
    ),
    [Revenue], DESC
)
ORDER BY [Revenue] DESC
```

Result: Top spender is Evelyn Smith (Singapore) — \$2,070.52 across 11 orders.

3. Revenue Trend by Month (growth trajectory)

```
dax

EVALUATE
SUMMARIZECOLUMNS(
    DateTable[year],
    DateTable[month_number],
    DateTable[month_name],
    "Revenue", [Total_Revenue],
    "Orders", [Total_Orders],
    "MoM Growth", [Revenue_MoM_Growth_Pct]
)
ORDER BY DateTable[year], DateTable[month_number]
```

Result: 24 months tracked (Jan 2024–Dec 2025). Use for board-deck trend lines with growth % built in.

4. Revenue Concentration / Pareto Check (risk: are we too dependent on a few customers?)

```
dax

EVALUATE
VAR CustRevenue =
    SUMMARIZECOLUMNS(
        Customers[customer_id],
        "Revenue", [Total_Revenue]
    )
VAR Top20PctCount = ROUNDUP(COUNTROWS(CustRevenue) * 0.2, 0)
VAR Top20Revenue =
    SUMX(TOPN(Top20PctCount, CustRevenue, [Revenue], DESC), [Revenue])
VAR TotalRev = [Total_Revenue]
RETURN
ROW(
    "Top 20% Customer Count", Top20PctCount,
    "Revenue from Top 20%", Top20Revenue,
    "Total Revenue", TotalRev,
    "% of Revenue from Top 20%", DIVIDE(Top20Revenue, TotalRev)
)
```

Result: Top 20% of customers (32 people) generate 40.6% of total revenue — moderate concentration, worth monitoring but not a red flag.

5. Revenue by Country (market expansion view)

```
dax

EVALUATE
SUMMARIZECOLUMNS(
    Geography[country],
    "Revenue", [Total_Revenue],
    "Customers", [Total_Customers],
    "% of Total", [Pct_of_Total_Revenue]
)
ORDER BY [Revenue] DESC
```

Result: USA leads at \$34,048.63 (37.9% of revenue), followed by Canada (\$9,758.36) and Australia (\$9,354.00).

6. Channel & Ad Platform Performance (marketing spend justification)

```
dax

EVALUATE
SUMMARIZECOLUMNS(
    Orders[Ad_Platform_Clean],
    "Revenue", [Total_Revenue],
    "Orders", [Total_Orders],
    "Avg Order Value", [Average_Order_Value]
)
ORDER BY [Revenue] DESC
```

Result: Organic dominates at \$45,274.52 (210 orders). Among paid channels, Instagram Ads leads at \$11,004.66, followed by Pinterest (\$9,931.94) and Google Ads (\$9,167.03 — highest AOV among paid at \$235.05).

7. Product Category Performance ("what should we double down on")

```
dax
```

```

EVALUATE
SUMMARIZECOLUMNS(
    Products[category],
    "Revenue", [Total_Revenue],
    "Units Sold", [Total_Units_Sold],
    "% of Total", [Pct_of_Total_Revenue]
)
ORDER BY [Revenue] DESC

```

Result: Apparel leads at \$24,485.64 (27.2%), then Accessories (\$20,915.42) and Footwear (\$17,231.25). Weakest: Electronics Accessories at \$4,282.72 — candidate for review or deprioritization.

8. New vs Returning Customer Revenue Split (retention health)

```

dax

EVALUATE
SUMMARIZECOLUMNS(
    Orders[First_Order_Flag],
    "Revenue", [Total_Revenue],
    "Orders", [Total_Orders],
    "Avg Order Value", [Average_Order_Value]
)

```

Result: Returning customers drive \$87,089.37 (409 orders); new customers only \$2,769.31 (11 orders) — business is heavily retention-driven, worth flagging if new-customer acquisition is a growth goal.

9. Order Fulfillment Health (operational risk check)

```

dax

EVALUATE
SUMMARIZECOLUMNS(
    Orders[order_status],
    "Order Count", [Total_Orders],
    "Revenue", [Total_Revenue]
)
ORDER BY [Order Count] DESC

```

Result: 354 Fulfilled (\$76,215.30) · 29 Refunded (\$5,906.54) · 22 Pending (\$5,194.46) · 15 Cancelled (\$2,542.38).

Ad-Hoc Single-Value Queries

The pattern below (`TOPN(1, ..., DESC/ASC)` wrapped in a `CALCULATETABLE` for date filters) answers any "which X had the highest/lowest Y in period Z" question a senior executive fires off in a message — no dashboard click-through needed.

Which product contributed the highest revenue in December 2025?

```
dax

EVALUATE
VAR TopProduct =
    CALCULATETABLE(
        TOPN(1, SUMMARIZECOLUMNS(Products[product_name], "Revenue", [Total_Reve
        DateTable[year] = 2025,
        DateTable[month_number] = 12
    )
RETURN TopProduct
```

Result: Wool Blend Coat — \$839.94

Who was the top customer in 2025?

```
dax

EVALUATE
VAR TopCustomer =
    CALCULATETABLE(
        TOPN(1, SUMMARIZECOLUMNS(Customers[customer_name], Geography[country],
        DateTable[year] = 2025
    )
RETURN TopCustomer
```

Result: Ava Clark (Spain) — \$1,328.89

What was the single best revenue day, all-time?

```
dax

EVALUATE
VAR BestDay =
    TOPN(1, SUMMARIZECOLUMNS(DateTable[date], "Revenue", [Total_Revenue]), [Rev
RETURN BestDay
```

Result: September 10, 2024 — \$1,133.75

Template for any future ad-hoc question (swap the grouping column, measure, filter, and ASC/DESC as needed):

```
dax

EVALUATE
VAR Answer =
    CALCULATETABLE(
        TOPN(1, SUMMARIZECOLUMNS(<GroupByColumn>, "Value", [<Measure>]), [Value
        <OptionalDateOrOtherFilter>
    )
RETURN Answer
```

Why this structure (the "Senior Executive Lens")

Executives don't want row-level detail — they want totals, trends, concentration risk, and channel ROI, each answerable in under 5 numbers. The 9 queries above cover: one summary snapshot, one ranked top-N, one trend-over-time, one risk/concentration check, and channel/category/segment comparisons. The ad-hoc pattern at the end means any new one-off question can be answered in under a minute without touching the report canvas.
